anchors are everyday items in construction however the ever more complex world of building has led to anchor technology being investigated in more and more scientific detail during the course of product development new anchor systems take into account the increasing diversity of base materials and the required economic efficiency the scientific studies result in sometimes highly complex engineering design methods that are specified in numerous codes of practice e g en 1992 4 eurocode 2 design of concrete structures part 4 design of fastenings for use in concrete as a result it is no longer possible to design an anchor with a simple quick and easily grasped manual calculation however the experience of the authors over the past 20 years shows that in order to gain the acceptance of users there is an urgent need to translate academic anchor theory into manageable anchor practice for real building sites it is exactly that gap that this book intends to fill the focus is on the practical use of anchors and answering practical questions such as which anchor do i need for my fastening task and what do i have to consider to answer this question the authors guide the reader through the seemingly vast number of anchor systems and provide advice for everyday building situations the theory regarding the structural behaviour is only explained and then only briefly when it helps to solve the fastening task and understand the solution to that task for clarity the reader is merely referred to the existing codes of practice and other specialist publications that provide summaries all authors have been working for many years with a focus on anchors and fastenings some of them in anchor testing laboratory or as trainers they are members of various working groups and committees in concrete and masonry structures

this book is a valuable read for a diverse group of researchers and practitioners who analyze assessment data and construct test instruments it focuses on the use of classical test theory ctt and item response theory irt which are often required in the fields of psychology e g for measuring psychological traits health e g for measuring the severity of disorders and education e g for measuring student performance and makes these analytical tools accessible to a broader audience having taught assessment subjects to students from diverse backgrounds for a number of years the three authors have a wealth of experience in presenting educational measurement topics in depth concepts and applications in an accessible format as such the book addresses the needs of readers who use ctt and irt in their work but do not necessarily have an extensive mathematical background the book also sheds light on common misconceptions in applying measurement models and presents an integrated approach to different measurement methods such as contrasting ctt with irt and multidimensional irt models with unidimensional irt models wherever possible comparisons between models are explicitly

made in addition the book discusses concepts for test equating and differential item functioning as well as bayesian irt models and plausible values using simple examples this book can serve as a textbook for introductory courses on educational measurement as supplementary reading for advanced courses or as a valuable reference guide for researchers interested in analyzing student assessment data
